

HORN BUILD

Guaranteed Quality

The building of ultrasonic sonotrodes resp. horns and anvils requires extensive Know-how in designing and manufacturing. Since more than 10 years we have specialized in this technologically sophisticated work. We build horns in all frequencies, for all ultrasonic-welding machines and for all industries.

The results are very economical horns, with a long life cycle, good pulsate attributes, equally distributed amplitudes and very minimal impedance.

During the construction phase, we acquire and calculate the best geometric propositions of the horn. Expensive and time-consuming adjustments during the production are therefore mostly eliminated, because the external geometries, the frequency, the pulsate form and pulsate-behavior etc. are known beforehand so we as one of very few manufacturers can guarantee the quality of our horns. Our guarantee relates to all aspects of the design and manufacturing.

Our system in designing and manufacturing causes significant advantages in quality and more so in time savings. These thereby resulting cost advantages we pass on to our costumers with pleasure.

Call us, we will examine your applications...
