

Precision catheter cutting machine with rotating knives

The new, semiautomatic catheter cutting machine device works with rotating knives and supplies bur free and precise cutting results in highest quality by the „pulling cut“ principle.

Our pneumatic as well as our semiautomatic catheter cutting devices are conceived and build in according to the requirements of our customers. The highest principle of our cutting devices – whether simply devices or devices in the highest stage of development – is absolute precision.

General view with control system

Through modular construction we could realize all desired stage of expansion. We use the latest CAD and FEM software for the construction to ensure a safety and fast development.

Versions

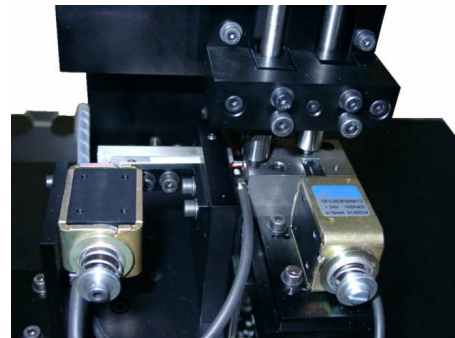

For the catheter cutting processing of multi-luminal catheters in all positions we offer an optional visual recognition. The catheters are inserted by hand and the positioning of the catheter beneath all angles, in all positions happens automatically.

Send us your catheter with requirements – we offer to you a suitable machine.

Bur free precision cuttings

The catheter tube is brought by an operator into the cutting position. An infrared sensor registered the reached final position and releases the further programmed operating steps.

Detail view cutting knife

In preparation

Full automatic catheter cutting machine with catheter delivery, processing and depot. With the full automatic catheter cutting machine you're be able to achieve the most usual precision cuttings in all positions.
